

Software Engineering & Project Management Lab Experiment No: - 02

Aim: To understand Version Control System / Source Code Management

Aim: To understand Version Control System / Source Code Management, install git and create a GitHub account.

Theory:

What Is Version Control?

A system called version control, sometimes referred to as source control or revision control, keeps track of changes made to a file or group of files over time so that you may retrieve particular versions at a later time. Although it can be applied to any circumstance where several versions of something are made and may need to be monitored and recalled, it is most frequently employed in software development.

What is GIT?

- a) Git is a free and open-source distributed version control system designed to handle everything from small to very large projects with speed and efficiency.
- b) Git relies on the basis of distributed development of software where more than one developer may have access to the source code of a specific application and can modify changes to it that may be seen by other developers..
- c) Initially designed and developed by Linus Torvalds for Linux kernel development in 2005.
- d) Every git working directory is a full-fledged repository with complete history and full version tracking capabilities, independent of network access or a central server.
- e) Git allows a team of people to work together, all using the same files. It helps the team cope with the confusion that tends to happen when multiple people are editing the same files.

What Is GitHub?

GitHub is an web based platform which hosts software development projects and uses Git for version management. Git is a distributed version control system that helps developers to work together on same software projects and keep track of changes made to their code by on another. GitHub offers a user-friendly interface, which is very collaborative tools, and more project management tools, GitHub will enhance the potential of the Git.

GitHub allows developers to create and manage the code in the repository in the remote location where others can acces the code or Github is an collection repositories which contains the files of the project.

What is Use Of Version Control Software?

- a) Version control software allows the user to have “versions” of a project, which show the changes that were made to the code over time, and allows the user to backtrack if necessary and undo those changes.
- b) This ability alone – of being able to compare two versions or reverse changes, makes it fairly invaluable when working on larger projects.
- c) In a version control system, the changes would be saved just in time – a patch file that could be applied to one version, in order to make it the same as the next version.
- d) All versions are stored on a central server, and individual developers checkout and upload changes back to this server.

Aim: To understand Version Control System / Source Code Management

What Are the Uses Cases Of GitHub?

Following are some of the use cases of GitHub:

- a) Version Control: GitHub is also called a version control system because of it uses such as if the certain developers are working on the same project and if any developer makes changes at it is affecting the entire code then they move back to previous version with immediate actions.
- b) Collaboration and Code Review: GitHub allows a group of developers work on same project where there can review each others code and can work on the same project which will improve the productivity and where they can develop the complex application in faster manner.
- c) Issue Tracking: Has a certain group of developers will work on the same project so when the issue arises in the GitHub then you can assign the issue to the other developer to whom you want.
- d) Open Source Development: The most widely used platform for open source development is GitHub.

What Are Characteristics of Git?

- ❖ Strong support for non-linear development
 - a. Git supports rapid branching and merging and includes specific tools for visualizing and navigating a non-linear development history.
 - b. A major assumption in Git is that a change will be merged more often than it is written.
 - c. Branches in Git are very lightweight.
- ❖ Distributed development
 - a. Git provides each developer a local copy of the entire development history, and changes are copied from one such repository to another.
 - b. The changes can be merged in the same way as a locally developed branch very efficiently and effectively.
- ❖ Compatibility with existing systems/protocol

Git has a CVS server emulation, which enables the use of existing CVS clients and IDE plugins to access Git repositories.
- ❖ Efficient handling of large projects
 - a. Git is very fast and scalable compared to other version control systems.
 - b. The fetching power from a local repository is much faster than is possible with a remote server.
- ❖ Data Assurance
 - a. The Git history is stored in such a way that the ID of a particular version depends upon the complete development history leading up to that commit.
 - b. Once published, it is not possible to change the old versions without them being noticed.
- ❖ Automatic Garbage Collection
 - a. Git automatically performs garbage collection when enough loose objects have been created in the repository.
 - b. Garbage collection can be called explicitly using `git gc --prune`.
- ❖ Periodic explicit object packing
 - a. Git stores each newly created object as a separate file. It uses packs that store a large number of objects in a single file (or network byte stream) called packfile, delta-compressed among themselves.
 - b. A corresponding index file is created for each pack file, specifying the offset of each object in the packfile.
 - c. The process of packing can be very expensive computationally.
 - d. Git allows the expensive pack operation to be deferred until later when time does

Aim: To understand Version Control System / Source Code Management

e. not matter.

How does GIT work?

- a. A Git repository is a key-value object store where all objects are indexed by their SHA-1 hash value.
- b. All commits, files, tags, and filesystem tree nodes are different types of objects living in this repository.
- c. A Git repository is a large hash table with no provision made for hash collisions.
- d. Git specifically works by taking “snapshots” of files

Steps to creating a Github account:

1. Go to GitHub Website

- Open your web browser and navigate to <https://github.com/>.

2. Sign Up for a New Account

- On the GitHub homepage, you'll see a "Sign up" button at the top right corner. Click on it.

3. Enter Your Personal Information

- Username: Choose a unique username. This will be how you are identified on GitHub.
- Email Address: Provide a valid email address. This is where you'll receive account-related notifications.
- Password: Create a strong password. GitHub will check if the password is secure and suggest improvements if needed.

4. Verify Your Account

- GitHub will ask you to solve a simple CAPTCHA challenge to confirm that you're not a bot. Follow the on-screen instructions to complete the CAPTCHA.

5. Choose a Plan

- GitHub offers Free and Paid plans. For most individual users, the Free plan will be sufficient. It includes unlimited public and private repositories with some limitations on team collaboration tools.
- Select the Free plan unless you need additional features like more advanced collaboration or private repositories.

6. Verify Your Email

- GitHub will send a verification email to the email address you provided earlier. Check your inbox (and spam/junk folder just in case) for the email and click the Verify email address button to confirm your email.

7. Complete the Setup (Optional)

- After email verification, GitHub might ask you to personalize your experience by answering a few questions about how you plan to use GitHub. This step is optional, and you can skip it.

8. Start Using GitHub

- Once you've completed the above steps, you'll be redirected to your GitHub dashboard.
- From here, you can create repositories, explore existing ones, collaborate with others, and start coding!

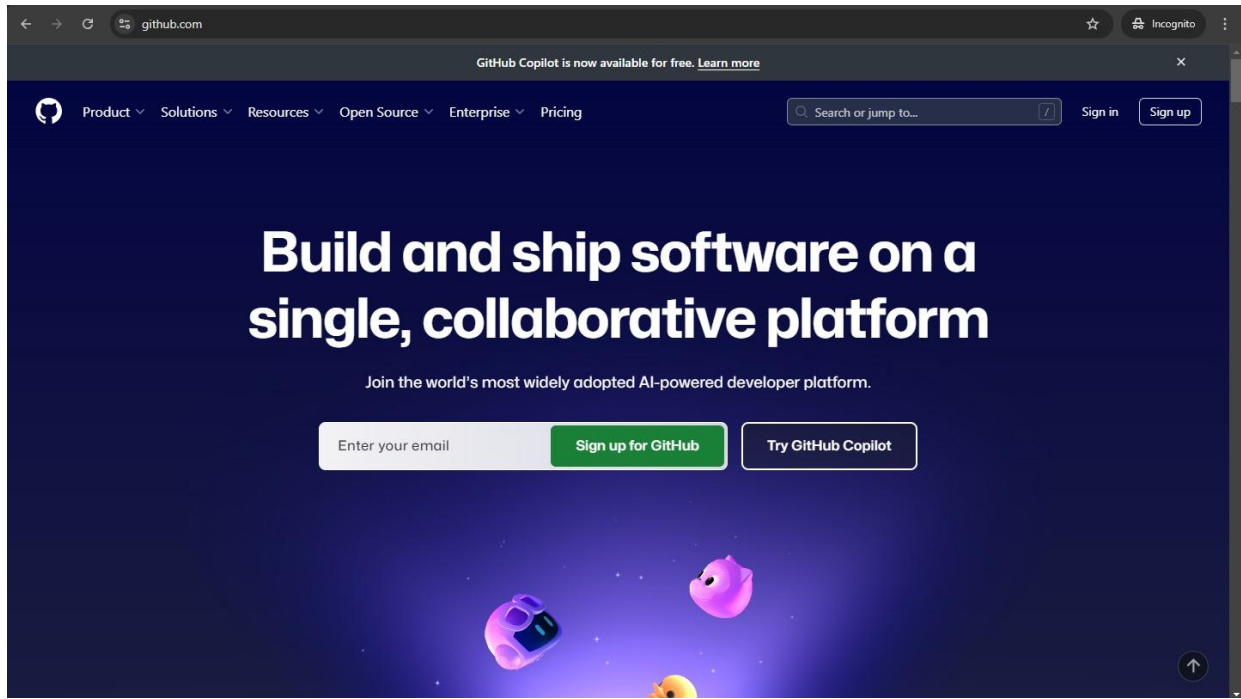

Additional Tips:

- Profile Setup: You can add more information to your profile later, such as a bio, profile picture, and links to social media or personal websites.
- SSH Keys: If you plan to use Git with GitHub (for cloning and pushing repositories), you may want to set up an SSH key for secure authentication.

Output:

Aim: To understand Version Control System / Source Code Management

A screenshot of the GitHub sign-up page. The left side has a dark blue background with the heading 'Create your free account' and a subheading 'Explore GitHub's core features for individuals and organizations.' Below that is a link 'See what's included'. The right side is white and contains the 'Sign up to GitHub' form. The form has three input fields: 'Email' (with 'inamdaralishaa@gmail.com'), 'Password' (with masked characters), and 'Username' (with '7i1sha'). Each field has a green checkmark icon. Below the password field is a note: 'Password should be at least 15 characters OR at least 8 characters including a number and a lowercase letter.' Below the username field is a note: 'Username may only contain alphanumeric characters or single hyphens, and cannot begin or end with a hyphen.' At the bottom of the form is a 'Continue >' button. Below the button is a small disclaimer: 'By creating an account, you agree to the Terms of Service. For more information about GitHub's privacy practices, see the GitHub Privacy Statement. We'll occasionally send you account-related emails.'

Signing up for a new personal account

1. Navigate to <https://github.com/>.
2. Click Sign up.
3. Follow the prompts to create your personal account.

During sign up, you'll be asked to verify your email address. Without a verified email address, you won't be able to complete some basic GitHub tasks, such as creating a repository.

Aim: To understand Version Control System / Source Code Management

Some enterprises create managed user accounts for their users. You can't sign up for a personal account with an email address that's already verified for a managed user account.

Step 01: Go to <https://github.com/join> in a web browser. You can use any web browser on your computer, phone, or tablet to join. Before you can create branches or make any pull requests, you'll need an account.

Step 02: Enter your personal details. In addition to creating a username and entering an email address, you'll also have to create a password.

Step 03: Click Verify to start the verification puzzle. The instructions vary by puzzle, so just follow the on-screen instructions to confirm that you are a human. A green checkmark will appear after completing the puzzle.

Step 04: Click the green Create account button. It's below the form, at the bottom of the page. This will take you to an email verification page.

Step 05: Verify your email by entering the code. After clicking Create account, you'll receive an email with a code.

Step 06: Select the free plan. On the plan selection page, scroll down to click the button for choosing a free plan. This will immediately take you to your GitHub dashboard
